

Start a new git repository from an existing project

- Initialize git.
- Add. gitignore file and indicate which all files to ignore.
- Git add all the files to staging area.
- Git commit the staged files.
- This commits to local repository now.

Next Connect to GitHub.

- Create a new repository in git. (Note -Don't create any file while creating in repository).
- Copy the URL.
- First add the remote repository, then push the local repo to remote.
 - `git remote add origin <URL>`
 - `git push -u origin master`

Note if you create remote repo with some file, git sees it as to different project with different commit history.so it will throw an error.
